

Based on the physics-chemistry share principle, this book focuses basic concepts and theories of physical chemistry. Examples, reflection questions for review and exercises are selected according to the specific situations of relevant majors. The book manages to use national legal measurement units based on international system of units (SI) and national standard symbols. Divided into 11 chapters, it covers four parts: chemical thermodynamics, chemical kinetics, electrochemistry, foundations of surface chemistry and colloid chemistry. This book involves basic concepts and laws of thermodynamics, thermodynamic potential function and basic equation, solution thermodynamics and activity, chemical reaction thermodynamics and chemical equilibrium, phase equilibrium thermodynamics and phase diagram, statistical thermodynamics foundation, chemical reaction dynamics, electrolyte solution, cell reaction thermodynamics, electrode process, foundations of surface chemistry and colloid chemistry, etc. This book arranges contents about chemical thermodynamics differently from most other textbooks, in order to make the content more compact, systematical and logical.
